

**Noise and Vibration Analysis
Technical Memorandum for
CREATE Project WA7**

January 2014

Purpose

The purpose of this technical memorandum is to evaluate the possible noise and vibration impacts associated with CREATE Project WA7. The analysis documented in this technical memorandum was conducted in accordance with the *CREATE Noise and Vibration Methodology, August 2011*, which is based on Federal Transit Administration (FTA) procedures and impact criteria and is outlined in the Railroad Noise Model User Guide dated 2006.

Background

Specific noise and vibration assessment guidelines developed for assessing noise and vibration impacts of proposed projects within the CREATE Program were used for this analysis. The CREATE assessment methodology was developed because, unlike highway and transit improvement projects, there are no guidance documents or methods specifically applicable for the evaluation of freight train traffic noise and vibration impacts. The FTA has developed a Transit Noise and Vibration Assessment manual dated May 2006 (FTA Manual) for the evaluation of transit projects, but this methodology does not specifically address freight train traffic.

Existing Setting and Noise Measurements

The land use along WA7 project area consists of a mix of residential, commercial, and industrial land uses, as well as three schools, two parks, and the Cook County Sheriff's Vocational Rehabilitation Impact Center. Representative noise measurements were taken at selected sensitive receptors along the WA7 project area in the Fall of 2012. Noise measurement sites were selected based on the proximity of proposed improvements to sensitive noise receptors. The noise measurement results were used to determine existing background noise levels along the WA7 project area.

The purpose of measuring existing noise levels is to determine the appropriate impact criteria based on the *CREATE Noise and Vibration Methodology* noise impact guidelines. Impact thresholds for increases in the cumulative noise exposure vary based on the existing noise level. A total of six short-term measurements were conducted at residential locations along the WA7 project area. The measurements were recorded as one-minute average noise levels (Leq) for at least one hour at each noise measurement location. Measurements were conducted between 10:00 AM and 6:00 PM. Table 1 shows the address where the noise measurements were conducted and the existing noise levels. Figures 1a and 1b show the location of the noise measurement sites.

Table 1 – Existing Noise Measurement Results

| Measurement Site | Address/Location | Land use | Date | Start Time | Stop Time | Hourly Noise Level, Leq | Day/Night Noise Level, Ldn |
|------------------|-------------------|-------------|------------|------------|-----------|-------------------------|----------------------------|
| WA7-N1A | 3645 S. Maplewood | Residential | 11/12/2012 | 14:47 | 16:30 | 48 | 46 |
| WA7-N1 | 3736 Campbell | Residential | 9/26/2012 | 11:01 | 12:25 | 56 | 54 |
| WA7-N2 | 2436 34th Place | Residential | 9/26/2012 | 16:27 | 17:33 | 61 | 59 |
| WA7-N3 | 2440 24th Place | Residential | 9/26/2012 | 14:04 | 15:32 | 52 | 50 |
| WA7-N4 | 2601 24th Street | Residential | 9/27/2012 | 10:16 | 11:19 | 60 | 58 |
| WA7-N4A | 2609 24th Street | Residential | 9/27/2012 | 10:16 | 11:21 | 55 | 53 |

Note: L_{dn} values were calculated using FTA procedures and measured L_{eq} values.

In order to determine background noise levels, the noise measurements results were modified to account for the noise sources other than the CREATE freight, commuter, or intercity passenger trains, according to the requirements of the *CREATE Noise and Vibration Methodology*. The goal is to have at least one hour of the measured noise levels at each location that does not include any CREATE program trains. The following procedures presented in the *CREATE Noise and Vibration Methodology* were used to determine the one hour background noise levels without CREATE program trains:

- Continuously measure the overall noise levels at each noise measurement site using one-minute L_{eq} values.
- Record the time interval when CREATE Program trains (i.e. trains traveling on tracks affected by the CREATE Program) pass in front of the noise measurement site.
- Extend the one-hour measurement time by the train event time length.
- Eliminate the one-minute L_{eq} values from the data set for the time intervals the CREATE Program train were pass-by.
- Calculate the hourly L_{eq} using the remaining data sets.

The background L_{dn} (day-night) noise levels without CREATE program trains were then computed from the hourly L_{eq} for residential land uses using the *CREATE Noise and Vibration Methodology*.

Impact Criteria

The FTA methodology included in the FTA Manual is generally applicable for assessing the potential noise and vibration impacts from the proposed CREATE projects; however, due to the differing characteristics of freight trains, some aspects of the FTA methodology have been modified for the purpose of applying it to the CREATE projects. The FTA impact criteria were developed from established basic research on noise annoyance; therefore, they are considered applicable for assessing CREATE impacts. These criteria are applicable to three categories of land use: Category 1 land uses - outdoor areas that require a quiet setting, such as Zen gardens and meditation fields; Category 2 land uses - residences and buildings where people normally sleep, such as homes, prisons, and hotels; and Category 3 land uses - institutional buildings with primarily day time use, such as schools and churches.

There are two levels of impacts cited in the FTA criteria: moderate and severe. A Moderate Impact is a change in the cumulative noise level that is noticeable to most people, but may not be sufficient to cause strong, adverse reactions from the community. A Severe Impact is a change in the cumulative noise level that a significant percentage of people would be highly annoyed by project noise.

The FTA evaluation of vibration impacts can be divided into three categories of land use. Category 1 land uses consists of buildings where vibration would interfere with interior operations, such as manufacturing facilities and hospitals with vibration-sensitive equipment. Category 2 land uses are residences and buildings where people normally sleep. Category 3 land uses are institutional buildings with primarily daytime use.

Noise Impact Analysis

Conducting a noise assessment in accordance to the *CREATE Noise and Vibration Methodology* follows three steps: a Noise Screening Procedure (determining the noise-sensitive receptors within the screening distance), a General Noise Assessment, and a Detailed Noise Analysis (if necessary).

As part of the Noise Screening Procedure, screening distances are used to identify noise-sensitive land uses within certain distances from the project. Sensitive receptors located within these screening distances are evaluated for potential noise and vibration impacts. The General Noise Assessment is conducted based on the procedures specifically developed for CREATE projects and outlined in the *CREATE Railroad Noise Model User Guide, 2006*. Noise levels are predicted at sensitive receptors for the existing conditions and for the future No-Build and Build alternatives. If the General Noise Assessment methods predict potential noise impacts, then the Detailed Noise Analysis methodology is used to refine the analysis to determine if the noise impacts are still predicted. The Detailed Noise Analysis provides the highest degree of accuracy using site-specific topographic information. If noise impacts are identified in the Detailed Noise Analysis, then mitigation will be evaluated in accordance with the *CREATE Noise and Vibration Methodology*.

Screening

A screening distance of 750 feet was established for almost the entire WA7 project area with the exception of one area where the screening distance was 1,200 feet. Figures 1a and 1b show the screening distances used for this project. The closest noise sensitive receptor is located 75 feet from an existing track.

General Noise Assessment

The General Noise Assessment was conducted for the Category 2 and 3 land uses closest to the proposed WA7 improvements. (No Category 1 land uses are located within the screening distances used for this project.) The closest receptors to the track alignment were modeled under the assumption that these locations represent the worst-case noise condition. However, additional second and third row receptors were also modeled to verify there were no other impacts beyond the first row.

Train operational data for 2009 were provided by the Chicago Transportation Coordination Office (CTCO) using the train model developed for the CREATE program. The train data were utilized to calculate noise levels at each of the representative receptors. Train operational data were counted and averaged for the 2009 Existing, 2029 Build, and 2029 No-Build scenarios. After train operation volume counts were entered into the CREATE General Noise Assessment spreadsheet, site-specific parameters such as building rows, train speeds, and track condition information were added for each modeled receptor.

After the existing, no-build, and build noise levels due to trains only were calculated, they were then logarithmically combined with the measured background noise levels at each receptor. The noise level difference between the existing (train plus background) noise level and the build (train plus background) noise level was used to determine noise impacts. General Noise Assessment results indicate a moderate impact at four receptors, but no severe impacts at any receptors. Table 2 shows the General Noise Assessment results.

Table 2 - General Noise Assessment Results

| Receptor No. | Land use | Overall Noise Levels (dBA) | | | Impact |
|--------------|----------|----------------------------|-----------------|--------------|-----------------|
| | | Existing (2009) | No-Build (2029) | Build (2029) | |
| WA7-R-01 | SFR | 59 | 56 | 57 | No Impact |
| WA7-R-02 | SFR/MFR | 57 | 55 | 56 | No Impact |
| WA7-R-03 | SFR/MFR | 55 | 54 | 55 | No Impact |
| WA7-R-05 | SFR/MFR | 55 | 54 | 54 | No Impact |
| WA7-R-14 | SFR | 50 | 48 | 49 | No Impact |
| WA7-R-15 | SFR/MFR | 49 | 47 | 48 | No Impact |
| WA7-R-16 | SFR | 47 | 47 | 47 | No Impact |
| WA7-R-17 | MFR | 50 | 47 | 48 | No Impact |
| WA7-R-18 | SFR/MFR | 48 | 47 | 47 | No Impact |
| WA7-S-01 | SCH | 47 | 48 | 48 | No Impact |
| WA7-R-04 | SFR/MFR | 55 | 55 | 55 | No Impact |
| WA7-R-19 | SFR/MFR | 55 | 52 | 53 | No Impact |
| WA7-R-23 | SFR | 65 | 62 | 63 | No Impact |
| WA7-R-24 | SFR | 62 | 61 | 60 | No Impact |
| WA7-R-12 | MFR | 59 | 63 | 61 | No Impact |
| WA7-R-13 | SFR | 66 | 70 | 68 | Moderate |
| WA7-P-01 | REC | 63 | 64 | 63 | No Impact |
| WA7-R-25 | SFR | 68 | 71 | 69 | No Impact |
| WA7-R-26 | SFR | 60 | 63 | 61 | No Impact |
| WA7-R-33 | SFR | 57 | 61 | 58 | No Impact |
| WA7-R-34 | SFR | 54 | 57 | 56 | No Impact |
| WA7-R-35 | SFR/MFR | 68 | 72 | 69 | No Impact |
| WA7-R-38 | SFR/MFR | 60 | 62 | 62 | No Impact |
| WA7-R-39 | SFR/MFR | 69 | 72 | 70 | No Impact |
| WA7-R-43 | SFR | 63 | 65 | 64 | No Impact |
| WA7-R-47 | MFR | 64 | 68 | 66 | No Impact |
| WA7-R-7 | SFR/MFR | 60 | 60 | 60 | No Impact |
| WA7-R-8 | SFR/MFR | 68 | 71 | 69 | No Impact |
| WA7-P-02 | REC | 63 | 64 | 63 | No Impact |
| WA7-C-02 | PR | 66 | 68 | 68 | Moderate |
| WA7-S-02 | SCH | 64 | 66 | 64 | No Impact |
| WA7-R-50 | SFR | 70 | 74 | 73 | Moderate |
| WA7-R-52 | SFR/MFR | 61 | 66 | 65 | Moderate |
| WA7-R-53 | SFR/MFR | 60 | 63 | 62 | No Impact |
| WA7-S-03 | SCH | 67 | 68 | 66 | No Impact |
| WA7-R-49 | SFR/MFR | 59 | 60 | 60 | No Impact |
| WA7-R-58 | SFR | 62 | 67 | 64 | No Impact |
| WA7-R-59 | SFR/MFR | 59 | 60 | 59 | No Impact |

Note: MFR - Multi-family Residences; SFR - Single-family Residences; Motel - MT; SCH - School; REC - Recreational Area; PR - Prison.

Detailed Noise Analysis

A Detailed Noise Analysis was then performed for the four receptors where moderate noise impacts were identified in the General Noise Assessment. The detailed analysis indicates WA7-C-02 would have a moderate noise impact as a result of the WA7 project. Table 3 shows the detailed analysis results. More information is contained in the Detailed Noise Analysis table in the appendix.

Table 3 - Detailed Noise Analysis Results

| Receptor No. | Land use | Overall Noise Levels (dBA) | | | Impact |
|--------------|----------|----------------------------|-----------------|--------------|-----------------|
| | | Existing (2009) | No-Build (2029) | Build (2029) | |
| WA7-R-13 | SFR | 66 | 69 | 67 | No Impact |
| WA7-C-02 | PR | 65 | 67 | 67 | Moderate |
| WA7-R-50 | SFR | 71 | 72 | 71 | No Impact |
| WA7-R-52 | SFR/MFR | 66 | 68 | 67 | No Impact |

Note: MFR - Multi-family Residences; SFR - Single-family Residences; Motel - MT; SCH - School; REC - Recreational Area; PR - Prison.

Noise Abatement Evaluation

The determination of a moderate noise impact using the Detailed Noise Analysis warrants the evaluation of noise mitigation of the project at the WA7-C-02 receptor location. A noise abatement evaluation was conducted following the guidance in the FTA Manual and the *CREATE Noise and Vibration Methodology*. At WA7-C-02, the noise source is at a higher elevation than the receptor. A noise wall was assumed to be situated at the bottom of the embankment, within railroad right-of-way. According to calculations, a wall 14 feet high would yield a six dBA reduction in train noise. Therefore, a noise wall would achieve the required noise reduction of at least five dBA and is considered feasible. However, construction of a noise barrier is not reasonable because it does not meet cost-effectiveness criteria. Therefore, the construction of a noise barrier is feasible, but not reasonable. Details of the evaluation can be found in the appendix.

L_{max} Estimation

L_{max} was estimated at the four locations in the detailed analysis as prescribed by the *CREATE Noise and Vibration Methodology*. The maximum value for each scenario was estimated to be 81 dbA for 2009 Existing, 80 dbA for 2029 No-Build, and 82 dbA for 2029 Build (all from locomotives). The full table may be seen in the appendix.

Vibration Assessment

Vibration impacts can be a result of both ground-borne vibration (GBV) and ground-borne noise (GBN). Vibration impacts are assessed for a one-time event and based on the maximum vibration level.

According to the *CREATE Noise and Vibration Methodology*, vibration assessment follows three steps: 1) Vibration Screening Procedure, 2) General Vibration Assessment, and 3) Detailed Vibration Analysis (if necessary). The CREATE Vibration Screening Procedure follows the methodology presented in the FTA Manual. If it is determined that there are vibration sensitive land uses along the project area within the screening distances, then a General Vibration Assessment is required. If impacts are identified in the General Vibration Assessment, then a Detailed Vibration Analysis may be used to refine and confirm whether a vibration impact occurs.

The Vibration Screening Procedure identified locations along the project alignment that were considered sensitive land uses. Therefore, a General Vibration Assessment for ground-borne vibration and an assessment for ground-borne noise were completed following the guidance in the CREATE methodology. The results of the GBV assessment are shown in Table 4.

Table 4 – GBV Assessment Results Summary

| Receptor | Land Use | Source | GBV Levels (VdB) | | | Potential Impact? |
|----------|----------|----------------------|------------------|-----------------|--------------|-------------------|
| | | | Existing (2009) | No-Build (2029) | Build (2029) | |
| WA7-R-25 | MFR | Freight - Rail Car | 68 | 71 | 78 | Yes |
| | | Freight - Locomotive | 69 | 72 | 80 | Yes |
| WA7-R-26 | SFR | Freight - Rail Car | 59 | 62 | 70 | No |
| | | Freight - Locomotive | 61 | 64 | 71 | No |
| WA7-R-35 | SFR/MFR | Freight - Rail Car | 64 | 64 | 68 | No |
| | | Freight - Locomotive | 65 | 65 | 69 | No |
| WA7-R-39 | SFR/MFR | Freight - Rail Car | 72 | 72 | 76 | Yes |
| | | Freight - Locomotive | 73 | 73 | 77 | Yes |
| WA7-R-47 | SFR/MFR | Freight - Rail Car | 65 | 65 | 69 | No |
| | | Freight - Locomotive | 66 | 66 | 70 | No |
| WA7-C-02 | PR | Freight - Rail Car | 60 | 58 | 60 | No |
| | | Freight - Locomotive | 61 | 59 | 61 | No |
| WA7-S-02 | SCH | Freight - Rail Car | 61 | 60 | 65 | No |
| | | Freight - Locomotive | 61 | 60 | 65 | No |
| WA7-R-50 | SFR | Freight - Rail Car | 75 | 74 | 79 | Yes |
| | | Freight - Locomotive | 76 | 75 | 80 | Yes |
| WA7-R-52 | SFR/MFR | Freight - Rail Car | 73 | 72 | 77 | Yes |
| | | Freight - Locomotive | 74 | 73 | 78 | Yes |
| WA7-S-03 | SCH | Freight - Rail Car | 64 | 63 | 68 | No |
| | | Freight - Locomotive | 66 | 65 | 70 | No |
| WA7-R-23 | SFR | Commuter Train | 84 | 83 | 84 | No |
| | | Freight - Locomotive | 80 | 74 | 81 | No |
| | | Freight - Rail Car | 79 | 73 | 79 | No |
| WA7-R-24 | SFR | Commuter Train | 79 | 78 | 79 | No |
| | | Freight - Locomotive | 75 | 69 | 78 | No |
| | | Freight - Rail Car | 74 | 68 | 77 | No |

Note: MFR - Multi-family Residences; SFR - Single-family Residences; Motel - MT; SCH - School; REC - Recreational Area; PR - Prison.

The results of the GBN assessment are show in Table 5.

Table 5 – GBN Assessment Results Summary

| Receptor | Land Use | Source | GBN Levels (VdB) | | | Potential Impact? |
|----------|----------|----------------------|------------------|-----------------|--------------|-------------------|
| | | | Existing (2009) | No-Build (2029) | Build (2029) | |
| WA7-R-25 | MFR | Freight - Rail Car | 18 | 21 | 28 | No |
| | | Freight - Locomotive | 19 | 22 | 30 | No |
| WA7-R-26 | SFR | Freight - Rail Car | 9 | 12 | 20 | No |
| | | Freight - Locomotive | 11 | 14 | 21 | No |
| WA7-R-35 | SFR/MFR | Freight - Rail Car | 14 | 14 | 18 | No |
| | | Freight - Locomotive | 15 | 15 | 19 | No |
| WA7-R-39 | SFR/MFR | Freight - Rail Car | 22 | 22 | 26 | No |
| | | Freight - Locomotive | 23 | 23 | 27 | No |
| WA7-R-47 | SFR/MFR | Freight - Rail Car | 15 | 15 | 19 | No |
| | | Freight - Locomotive | 16 | 16 | 20 | No |
| WA7-C-02 | PR | Freight - Rail Car | 10 | 8 | 10 | No |
| | | Freight - Locomotive | 11 | 9 | 11 | No |
| WA7-S-02 | SCH | Freight - Rail Car | 11 | 10 | 15 | No |
| | | Freight - Locomotive | 11 | 10 | 15 | No |
| WA7-R-50 | SFR | Freight - Rail Car | 25 | 24 | 29 | No |
| | | Freight - Locomotive | 26 | 25 | 30 | No |
| WA7-R-52 | SFR/MFR | Freight - Rail Car | 23 | 22 | 27 | No |
| | | Freight - Locomotive | 24 | 23 | 28 | No |
| WA7-S-03 | SCH | Freight - Rail Car | 14 | 13 | 18 | No |
| | | Freight - Locomotive | 16 | 15 | 20 | No |
| WA7-R-23 | SFR | Commuter Train | 34 | 33 | 34 | No |
| | | Freight - Locomotive | 30 | 24 | 31 | No |
| | | Freight - Rail Car | 29 | 23 | 29 | No |
| WA7-R-24 | SFR | Commuter Train | 29 | 28 | 29 | No |
| | | Freight - Locomotive | 25 | 19 | 28 | No |
| | | Freight - Rail Car | 24 | 18 | 27 | No |

Note: MFR - Mutli-family Residences; SFR - Single-family Residences; Motel - MT; SCH - School; REC - Recreational Area; PR - Prison.

These assessments indicate four potential GBV impacts (due to freight locomotives and rail cars) and no GBN impacts as a result of the WA7 project. Three of these moderate impacts are located on the east side of the Western Avenue Corridor where there is no proposed work under this project. The fourth impact is in the area of the new wye at Brighton Park. There is no special track work in the immediate area of the connection. Where GBV or GBN impacts are indicated in the *CREATE Noise and Vibration Methodology*, a Detailed Vibration Analysis is required only when planning and design of special track work or buffer zones are viable mitigation measures. Planning and design of special track work is not a viable mitigation option because most tracks in the WA7 project area are existing tracks. Similarly, additional buffer zones are not viable mitigation options in the WA7 project corridor.

The following maintenance procedures will be accomplished by the rail industry to mitigate vibration impacts through the minimizing of vibration sources:

- Regularly scheduled rail grinding
- Wheel truing programs
- Vehicle reconditioning programs
- Use of wheel-flat detectors.

Construction Noise and Vibration

The construction of the proposed project could result in temporary noise and vibration increases within and adjacent to the project area. The noise and vibration will be generated primarily from trucks and heavy machinery used during construction. Any anticipated noise and vibration impacts will likely be confined to normal working hours, which are generally considered to be “noise and vibration tolerant” periods. Construction contractors need to be aware of local noise ordinances to assure compliance in Cook County and within the cities that construction activities occur. No adverse noise and vibration impacts are anticipated during the construction phase of the project. Vibration impacts typically include both ground-borne vibration and ground-borne noise.

Conclusion

One moderate impact was identified in the detailed noise analysis. A noise abatement evaluation determined that a noise wall is feasible, but not reasonable. The general vibration assessment identified potential GBV impacts at four receptors. However, providing buffer zones and moving special track work are not viable mitigation options for this project. The noise and vibration analyses for this project may need to be reassessed if: a) the project is revised in a manner in which impacts of the project may change due to the project revisions (e.g., a new track alignment is moved closer to a receptor), or b) the CREATE Program's train model is updated due to projects being removed or added to the CREATE Program.

Detailed tables for the noise and vibration analyses are provided in Appendix A.

Notes:

1 - FTA Noise Impact Criteria apply 24-hour L_{dn} for residents and prisons (Land Use Category 2) and hourly L_{eq} for schools and recreational areas (Land Use Category 3).

2 - MFR - Multi-family Residences; SFR - Single-family Residences; Motel - MT; SCH - School; REC - Recreational Area; PR - Prison.

3 - Background noise levels determined from one-hour measurement data or from a representative location.

4 - Overall noise levels are the logarithmic addition of the background noise level (without trains) and predicted train noise under the existing, no-build, and build conditions. Existing, no-build and build train noise levels were predicted using the FTA General Assessment spreadsheet (CREATE Version).

Detailed Noise Analysis

| Site No. | FTA Land Use/ Noise Metric ¹ | No. of Buildings Within Cluster | Exisiting Land Use ² | Background Noise Level, dBA ³ | Predicted Overall Noise Levels, dBA ⁴ | | | Build Increase Over Existing, dBA | FTA Allowable Increase, dBA Moderate/ Severe | FTA Impact Level |
|----------|---|---------------------------------|---------------------------------|--|--|-----------------|--------------|-----------------------------------|--|------------------|
| | | | | | Existing (2009) | No-Build (2029) | Build (2029) | | | |
| WA7-R-13 | 2/ L _{dn} | 3 | SFR | 54 | 66 | 69 | 67 | 1 | 1/4 | No Impact |
| WA7-C-02 | 2/ L _{dn} | 9 | PR | 58 | 65 | 67 | 67 | 2 | 1/4 | Moderate |

| WA7-R-52 | 2/ L _{dn} | 11 | SFR/MFR | 50 | 66 | 68 | 67 | 1 | 1/4 | No Impact |

Notes:

1 - FTA Noise Impact Criteria apply 24-hour L_{dn} for residents and prisons (Land Use Category 2) and hourly L_{eq} for schools and recreational areas (Land Use Category 3).

2 - MFR - Mutli-family Residences; SFR - Single-family Residences; Motel - MT; SCH - School; REC - Recreational Area; PR - Prison.

3 - Background noise levels determined from one-hour measurement data or from a representative location.

4 - Overall noise levels are the logarithmic addition of the background noise level (without trains) and predicted train noise under the existing, no-build, and build conditions. Existing, no-build and build train noise levels were predicted using the FTA General Assessment spreadsheet (CREATE Version).

Assessment Level: Abatement Evaluation

| Receptor | WA7-C-02 |
|--|-------------------------|
| Noise Metric | L _{dn} |
| Existing Overall Noise Exposure | 65 dBA |
| Build Overall Noise Exposure | 67 dBA |
| Increase in Overall Noise Exposure | 2 dBA |
| Allowable increase before moderate impact | 1 dBA |
| Allowable increase before severe impact | 4 dBA |
| Impact Level | Moderate |
| Increase over Moderate Impact Threshold ¹ | 1 |
| Number of Benefited Receptors ² | 9 |
| Reasonable Cost per Benefited Receptor ³ | \$5,000 |
| Reasonable Cost of Noise Wall ⁴ | \$45,000 |
| Potential Noise Wall Location | At bottom of Embankment |
| Noise Wall Height ⁵ | 16 ft |
| Approximate Noise Wall Length ⁶ | 950 ft |
| Unit Noise Wall Cost ⁷ | \$37.50 |
| Total Noise Wall Cost ⁸ | \$570,000 |
| Train Noise Reduction due to Soundwall | 6 dBA |
| Does Noise Wall Achieve Noise Reduction Goal? ⁹ | Yes |
| Does Noise Wall Achieve the Economic Reasonability Policy Value? ¹⁰ | No |
| Is Noise Wall Likely to be Implemented? | No |

Notes:

- 1 - "Increase over the Moderate Impact Threshold" is the "Increase in Overall Noise Exposure" minus the "Allowable increase before moderate impact".
- 2 - A benefited receptor is a receptor with predicted noise impacts and that receives a Build Scenario CREATE Program Train Noise Level (Design Year) noise reduction of 5 dBA or more.
- 3 - For severe impacts, an upper limit of \$30,000 per benefited receptor. For moderate impacts, an upper limit of \$5,000 per benefited receptor for each decibel meeting or exceeding the impact threshold, up to \$30,000 per dwelling.
- 4 - "Reasonable Cost of Noise Wall" is the product of the "Reasonable Cost per Benefited Receptor" and the total "Number of Benefited Receptors". For multiple clusters benefited by one noise wall, it is the sum of the individual clusters' products. This is the maximum noise wall cost that would be economically reasonable under the policy.
- 5 - The height of a noise wall necessary to achieve a noise reduction goal of 5 dBA or more in future CREATE Program train noise.
- 6 - Potential wall is at least the length of the cluster footprint exposed to the train noise. The length would additionally extend in each direction from the receptor cluster for distance of 4 times the distance between receptor and the closest track in the Build condition.
- 7 - Noise wall costs are based on \$25.00 per square foot unit cost for walls up to 15 feet tall; \$37.50 per square foot up to 30 feet tall; and \$50.00 per square foot up to 45 feet tall.
- 8 - "Total Noise Wall Cost" is the product of the "Unit Noise Wall Cost" and the noise wall surface area.
- 9 - Noise mitigation measures must provide a Build Scenario CREATE Program Train Noise Level (Design Year) - noise reduction of at least 5 dBA for the mitigation measure to be considered feasible.
- 10 - Does the "Reasonable Cost of the Noise Wall" exceed the "Total Noise Wall Cost"? If "Yes", then the noise wall achieves the Economic Reasonability Policy Value.

Notes:

⁽¹⁾ Determine if event is frequent; occasional or infrequent event. Refer to Table 7-1 for definition.

⁽²⁾ Distances measured from centerlines of existing and proposed tracks to faces of buildings.

⁽³⁾ Generalized Ground Surface Vibration Curve (Figure 10-1) for locomotive-powered passenger or freight trains at 50 mph.

⁽⁴⁾ Highest vibration level, from the Generalized Vibration Curve (Figure 10-1), of either Track 1 or Track 2 at each receptor. The example project assumes the same adjustments are applied to both tracks. If the same adjustments cannot be applied to all tracks, the analyst may have to apply adjustments to the tracks individually to determine the highest predicted vibration at each receptor.

The "Predicted Build" is the same as the "Build Scenario CREATE Program Train Vibration Level (Design Year)" as referenced in the Noise and Vibration Methodology Section 7.2.2 except when analyzing moved existing tracks. When analyzing moved existing tracks, the "Predicted Build" considers the total number of trains using those tracks in the design year to determine the frequency category (frequent, occasional or infrequent) and impact level in Table 7-1, as well as the vibration level.

| | Speed Adjustments | | | Source Adjustments | | Path Adjustments | | | Receiver Adjustments | | | |
| Receptors | Highest ⁽¹⁾ Vibration Level @ 50 mph at Each Receptor No-Build (VdB) | Average Track Speed - No-Build (mph) | Speed Adjustment No-Build (VdB) | Vehicle ⁽²⁾ Condition Existing (VdB) | Elevated Structure ⁽³⁾ Adjustment Existing (VdB) | Propagation Geology ⁽⁴⁾ Adjustment Existing (VdB) | Wood Frame Structure (VdB) | Masonry Structure (VdB) | 1-5 Floors Above Grade (VdB) | Floor Amplifi- cation (VdB) | No-Build Vibration (VdB) | No-Build GBN (dBA) |
| WA7-R-23 | 74 | 9 | -15 | 10 | -5 | 10 | -5 | 0 | -2 | 6 | 73 | 23 |
| WA7-R-24 | 71 | 9 | -15 | 10 | -5 | 10 | 0 | -7 | -2 | 6 | 68 | 18 |

Notes:

- ⁽¹⁾ Highest Vibration Level, from the Generalized Vibration Curve (Figure 10-1), of either the Southbound (Track 1) or Northbound (Track 2) at each receptor.
- ⁽²⁾ Worn wheel adjustment made for Freight Rail Car. For locomotives assume no worn wheel adjustment
- ⁽³⁾ The existing tracks are on elevated structure/embankment (they are at least 1 feet higher than the base elevation at all receptors).
- ⁽⁴⁾ Existing geological conditions assumed to have "efficient" vibration propagation.

The "Predicted No-Build" is the "No-Build Scenario CREATE Program Train Vibration Level (Design Year)" which includes all train vibration from no-build scenario (design year) trains operating on tracks affected by the CREATE Program.

Commuter Locomotives**

| Receptors | Peak Day No-Build Volumes | No-Build Frequency Category ⁽¹⁾ | Distance ⁽²⁾ Existing Track 1 (feet) | Distance ⁽²⁾ Existing Track 2 (feet) | Generalized Vibration Curve ⁽³⁾ Existing Track 1 (VdB) | Generalized Vibration Curve ⁽³⁾ Existing Track 2 (VdB) | Highest ⁽⁴⁾ No-Build Vibration Level at Each Receptor (VdB) |
|-----------|---------------------------|--|---|---|---|---|--|
| WA7-R-23 | 20 | infrequent | 43 | 56 | 85 | 83 | 85 |
| WA7-R-24 | 20 | infrequent | 66 | 79 | 82 | 80 | 82 |

Notes:

⁽¹⁾ Determine if event is frequent; occasional or infrequent event. Refer to Table 7-1 for definition.

⁽²⁾ Distances measured from centerlines of existing tracks to faces of buildings.

⁽³⁾ Generalized Ground Surface Vibration Curve (Figure 10-1) for locomotive-powered passenger or freight trains at 50 mph.

⁽⁴⁾ Highest vibration level, from the Generalized Vibration Curve (Figure 10-1), of either Track 1 or Track 2 at each receptor. The example project assumes the same adjustments are applied to both tracks. If the same adjustments cannot be applied to all tracks, the analyst may have to apply adjustments to the tracks individually to determine the highest predicted vibration at each receptor.

The "Predicted No-Build" is the "No-Build Scenario CREATE Program Train Vibration Level (Design Year)" which includes all train vibration from no-build scenario (design year) trains operating on tracks affected by the CREATE Program.

The map displays an aerial view of a residential and commercial area. A red line indicates the WA7 Proposed Alignment, which runs vertically through the center-right of the map. A yellow line represents the Screening Distance - Vibration (200 feet), which follows the alignment and curves around the top. Blue rectangles highlight Receptor Clusters. Green squares indicate 'No' potential impact, while yellow squares indicate 'Yes'. Labels for streets include 21st Pl, 22nd Pl, 23rd Pl, 24th Pl, 25th Pl, 26th Pl, 27th St, 28th St, 31st St, 23rd St, 24th St, 25th St, 26th St, 28th St, 31st Bv, Cermak Rd, Washtenaw Av, Rockwell St, California Bv, Blue Island Av, Artesian Av, and Oakley Av. Receptor clusters are labeled with codes: WA7-S-03, WA7-R-52, WA7-R-56, WA7-C-02, and WA7-S-02.
